SUMMARY

Computer Science student at BINUS University with experience building academic and personal projects in web development, machine learning, and programming. Interested in software engineering, backend, web development, and general CS internship opportunities.

EXPERIENCE

Bartender

Rasmus Rask Baren

March 2026 - Present, 5200 Odense, Denmark

- Managed multiple tasks efficiently during busy service periods while maintaining service quality.
- Delivered prompt and attentive service while efficiently preparing beverages and handling customer requests in a high-volume bar environment.

Student Organization Activities

HIMTI

April 2024 - September 2025

- Supported promotion, publication, and marketing activities for student events organized by HIMTI.
- Collaborated with committee members to help communicate event information and improve outreach.

PROJECT

AndRpaid

github.com/Nobunaga20/andrpaid • November 2025 - January 2026

- Developed **AndRPaid**, a Laravel 11 and MySQL-based research management platform that helps lecturers and universities manage research projects, collaborations, literature reviews, methodologies, results, and publication workflows in one centralized system.
- Implemented core features including **dual-role authentication**, lecturer/university dashboards, affiliation verification, researcher discovery, collaboration management, and a structured research workspace with LaTeX/KaTeX formula rendering.

Round-Robin CPU Scheduler Simulation in C

github.com/Nobunaga20/round-robin-scheduler • December 2025 - December 2025

- Implemented a **Unix-based Round-Robin CPU scheduler in C** using process control, `fork()`, POSIX signals, and interval timers to simulate time-sharing execution across multiple child processes.
- Designed scheduler logic to manage process preemption with `SIGSTOP/SIGCONT`, terminate completed processes with `SIGKILL`, and rotate execution based on configurable time slices and burst times.

Toxic Comment Classification using NLP and DistilBERT

github.com/Nobunaga20/TF-IDF-Regression-VS-DistilBERT-on-Toxic-Comment-Classification • November 2025 - December 2025

- Built a **multi-label toxic comment classification system** using NLP to detect toxicity categories such as toxic, severe toxic, obscene, threat, insult, and identity hate from online comments.
- Implemented and compared **TF-IDF + Logistic Regression** as a baseline model with a fine-tuned **DistilBERT transformer model**, evaluating performance using Macro ROC-AUC and Macro F1-score on the Jigsaw Toxic Comment Classification dataset.

Low-Light Image Enhancement using Zero-DCE

github.com/Nobunaga20/Zero-DCE-Low-Light-Enhancement • November 2025 - December 2025

- Implemented a **Zero-DCE deep learning model** using TensorFlow/Keras to enhance low-light images through zero-reference learning, applying iterative pixel-wise adjustment curves without requiring paired training data.
- Built a **real-time Streamlit web application** for low-light image enhancement, using a lightweight CNN architecture trained on the LOL dataset and evaluated with PSNR, SSIM, NIQE, and GMSD metrics.

Inventory Management Web Application

- Built a CRUD-based inventory management website using Laravel + MySQL + Blade for item tracking and record management.
- Implemented core operations for creating, viewing, updating, and deleting inventory data.

EDUCATION

Exchange Student

University of Southern Denmark • Campusvej 55, 5230 Odense, Denmark • February 2026 - July 2026

Computer Science

SKILLS

Programming Languages: Python, C++, Laravel, Blade, MySQL

Tools: Figma

Languages: Indonesian (Native), English (IELTS 7.5)
